Can we use surface data for historical climate reconstructions?

GOAL

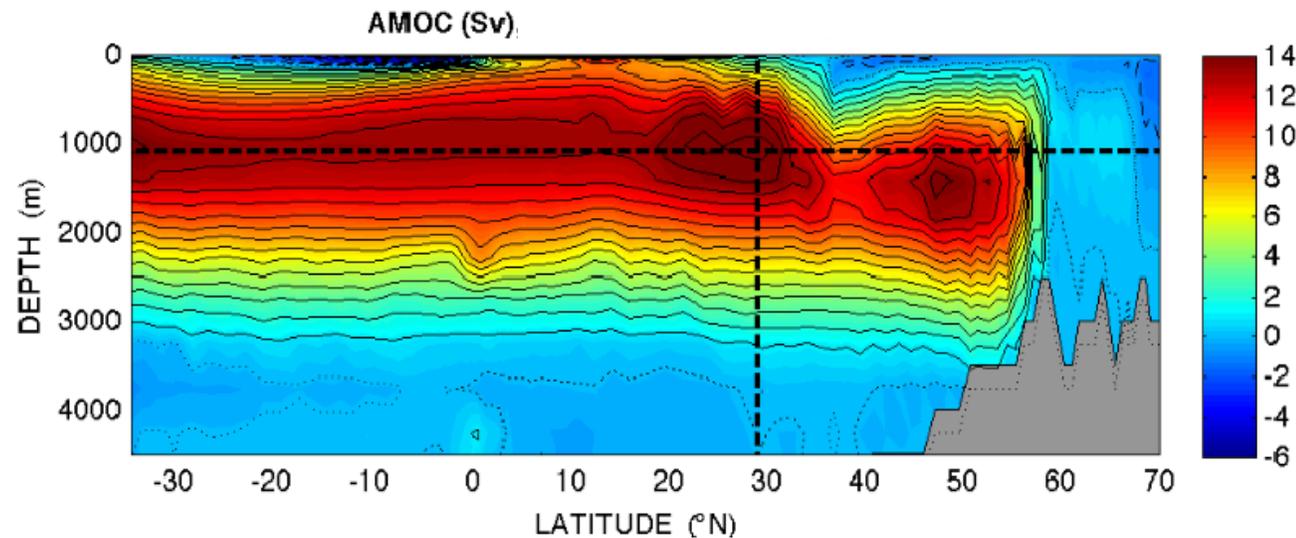

- i) To obtain a reconstruction of the Atlantic Meridional Overturning Circulation (AMOC) from 1900
- ii) Use this reconstruction as initial condition for Decadal predictions experiments (DCPPA)

Atlantic Meridional Overturning Circulation (AMOC)

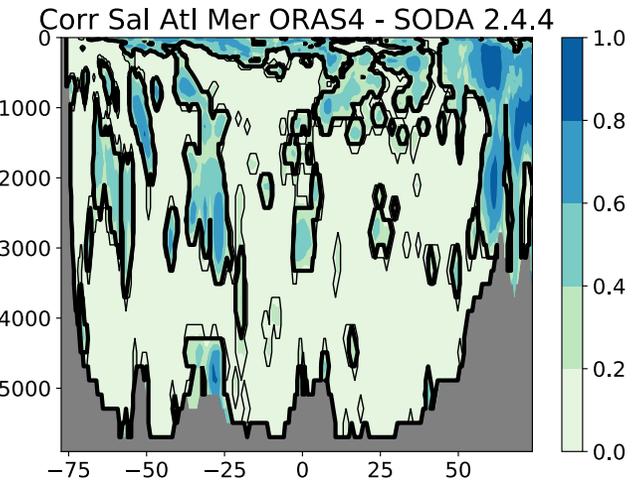

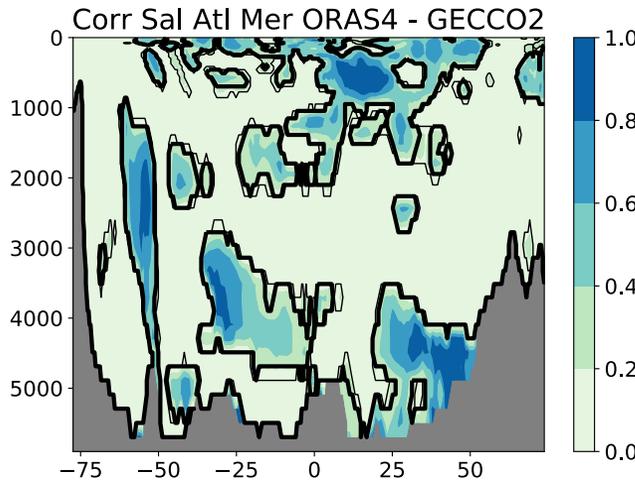

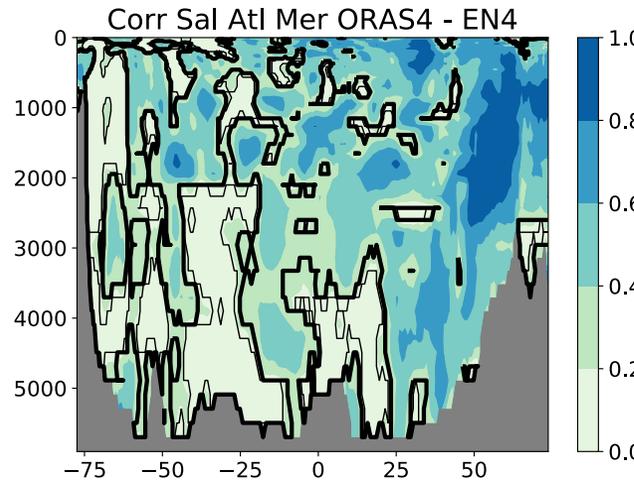

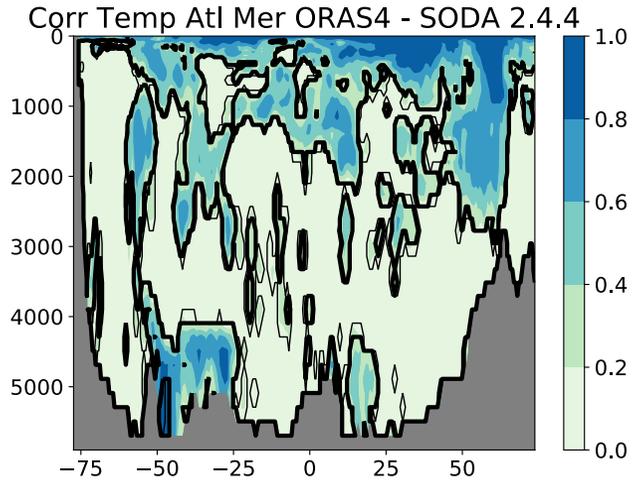

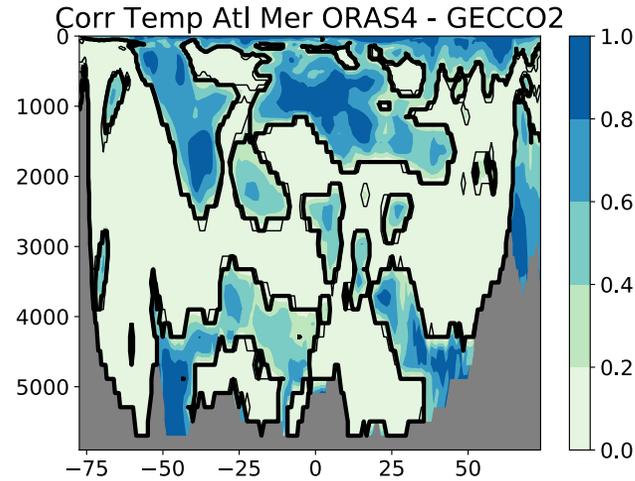

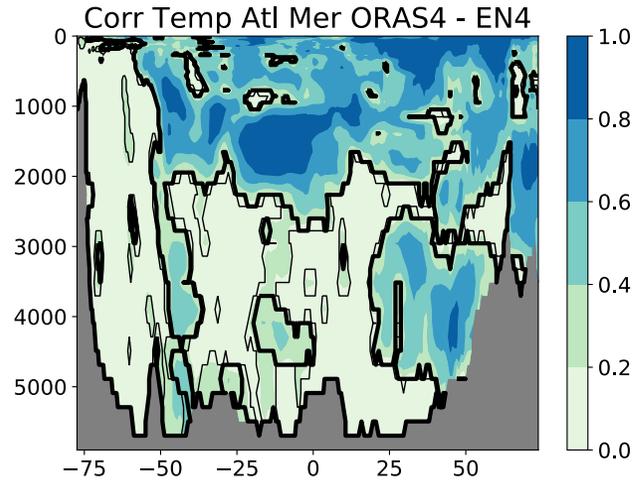

- Key driver of the Atlantic and Global climate in long time scales.
- Primary means of heat & carbon transport from surface to deep ocean.
- Provides a milder weather for western Europe when compared to similar latitudes
- Strong connections with various elements of the climate system: NAO, Arctic, etc.

Increase the skill of
the AMOC
reconstruction with
surface data
⇒
Improve the Initial
Conditions for decadal
predictions?

Why Surface data?

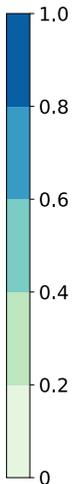

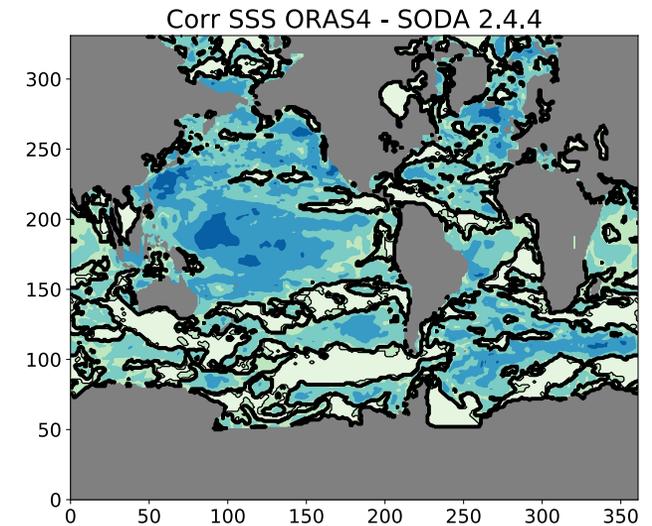

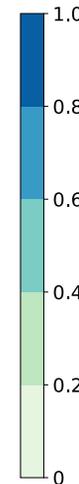

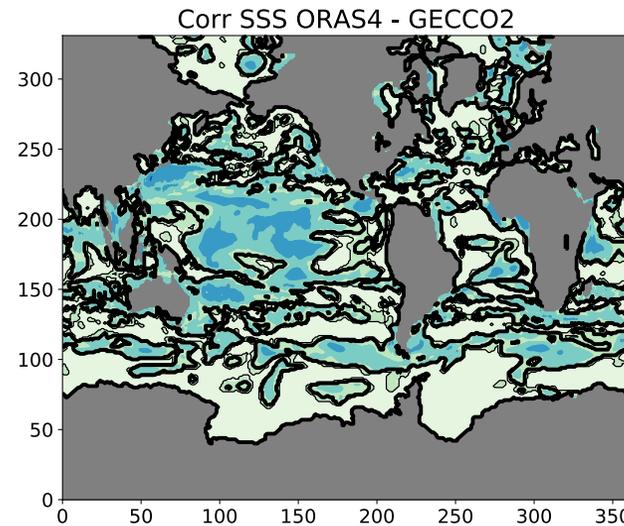

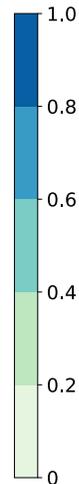

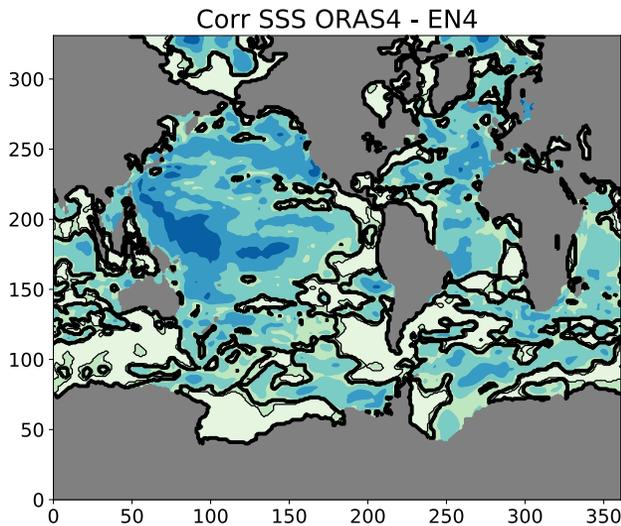

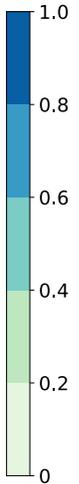

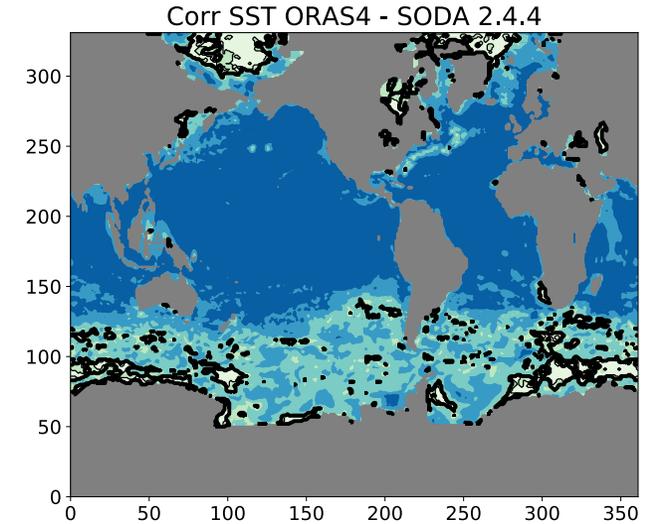

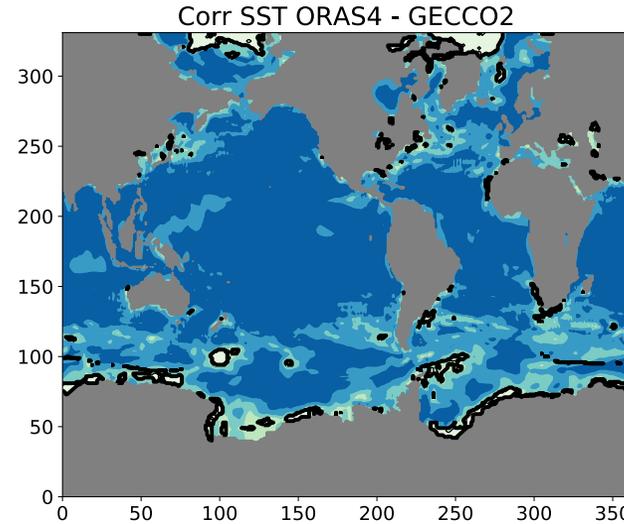

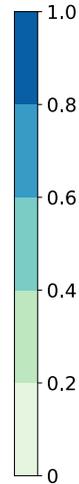

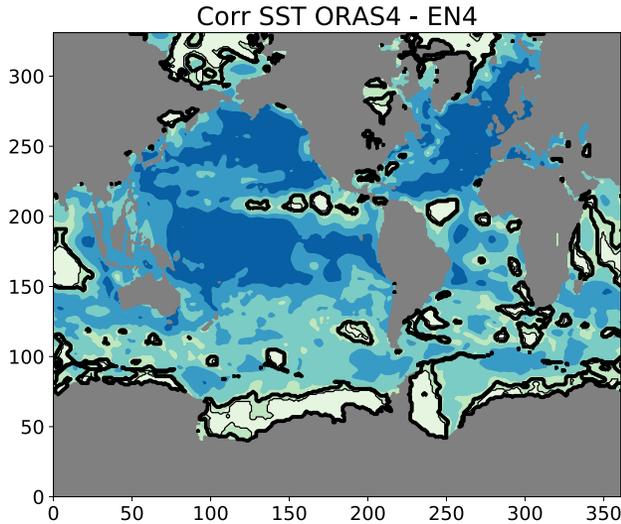

Meridional correlations of Salinity (top) and Temperature (bottom) 1960-2010
ORAS4 vs EN4, GECCO2 and SODA 2.4

- 3D data assimilation don't agree over the historical period
- There is no long term 3D data
- Introduce a drift in the ocean dynamics

Why Surface data?

Surface correlations of SSS (top) and SST (bottom)
ORAS4 vs EN4, GECCO2 and SODA 2.4
Between 1960 and 2010

- Don't interfere too much with ocean dynamics
- Longer records with better quality (biases and uncertainties better studied)

Previous experience on using surface data to reconstruct the AMOC

$$\frac{\partial SST_{model}}{\partial t} = \dots + \gamma_T(SST_{model} - SST_{target})$$

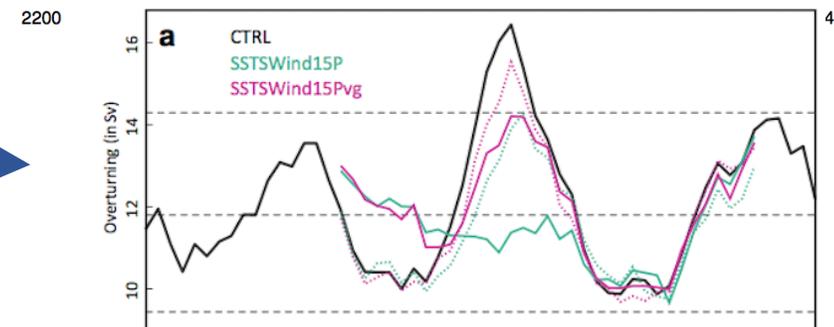

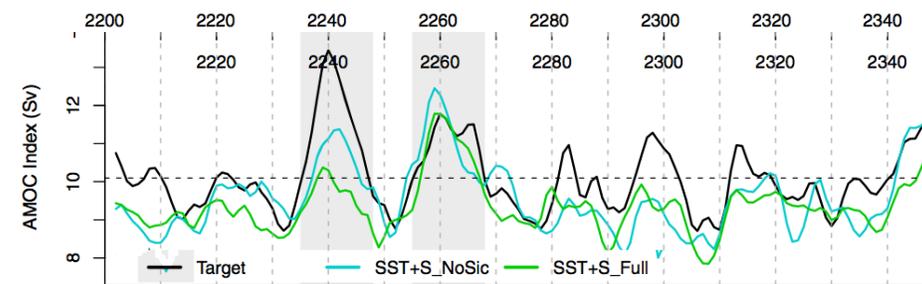

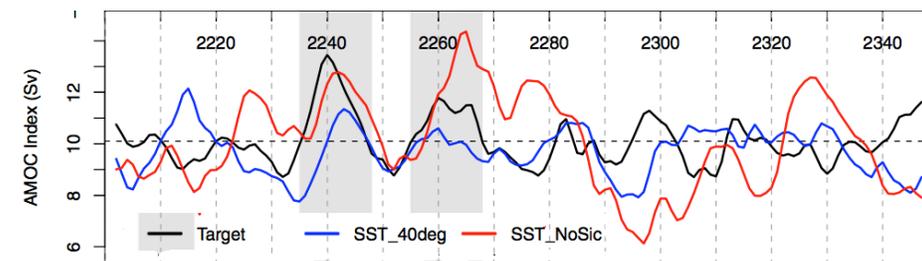

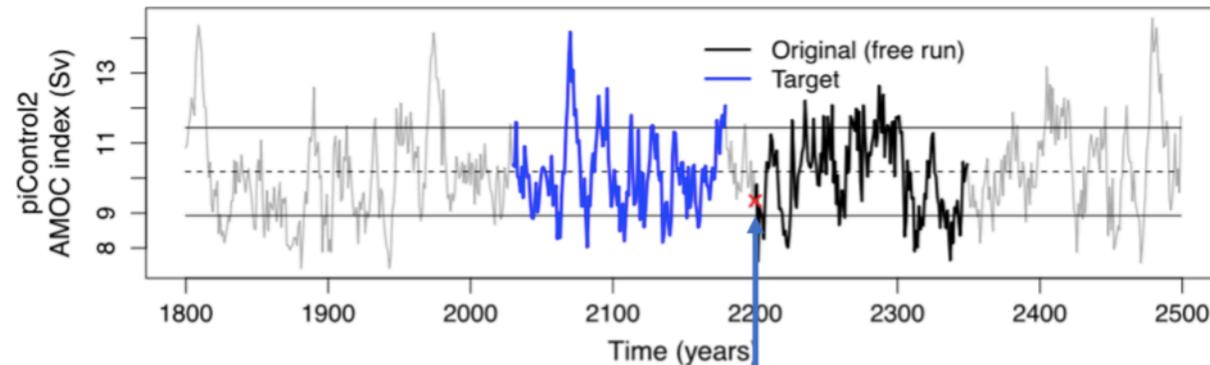

$$\frac{\partial SSS_{model}}{\partial t} = \dots + \gamma_S(SSS_{model} - SSS_{target})$$

Servonnat et al. 2014

- 1) We both need SSS and SST to be able to reconstruct the AMOC
- 2) We need to nudge outside the ice

Ortega et al. 2017

- 3) Variable with respect to the mixed layer depth
- 4) Variable gamma, and wind, improve the AMOC reconstruction.

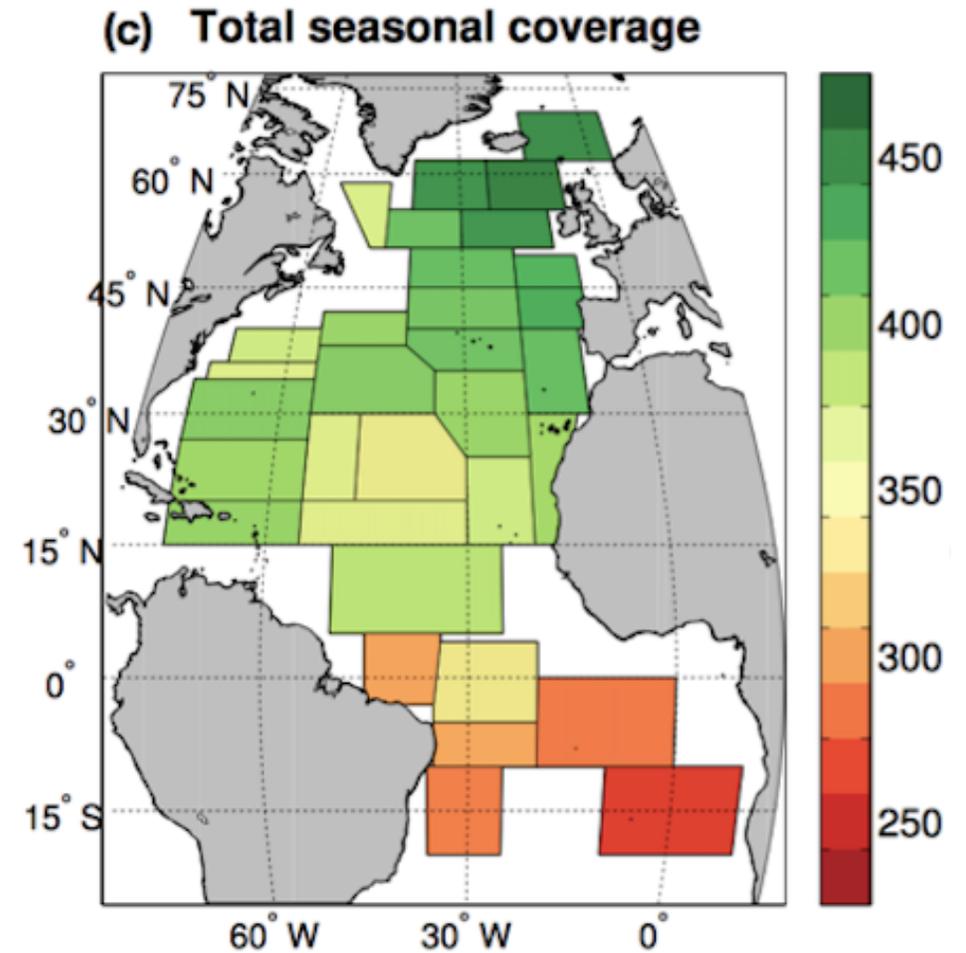

Historical Surface Data

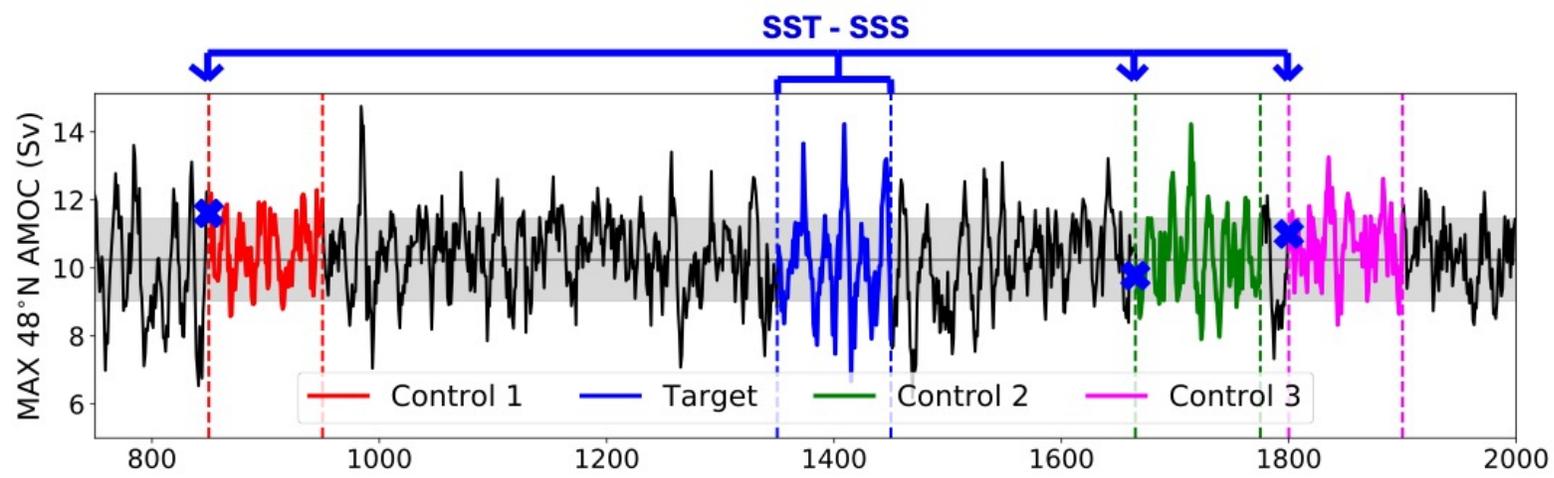

SST - assuming good coverage 👍

SSS - Friedman Data Set (FDS, Friedman et al. 2017)

- Based on data only 👍
- Long 1896–2013 👍
- 32 Boxes on scales between 100-1000 Km 👎
- Anomalous annual means 👎
- Not well sampled: Amazon, North of gulf Stream, or gulf of Guinea. 👎

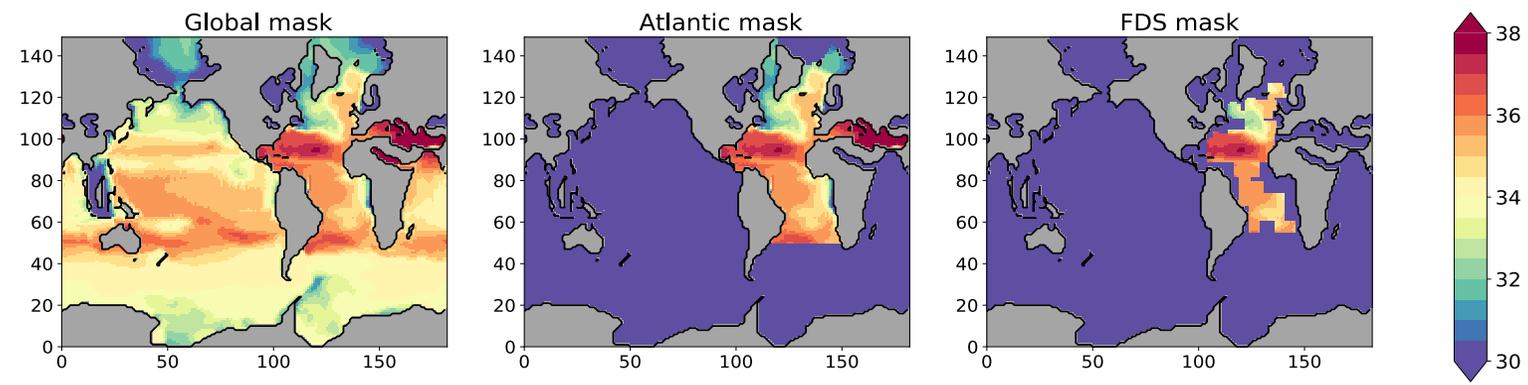

Can we use these data for historical reconstructions? ⇒ Test first in a perfect model framework

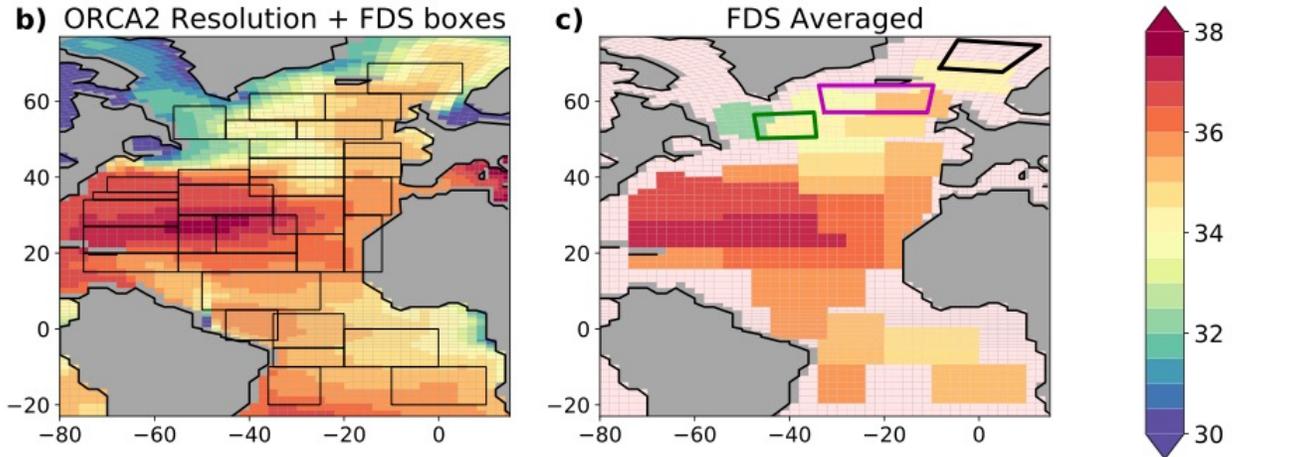

Perfect model framework

2 Main problems to solve

Reduce the SSS nudging region to the FDS mask

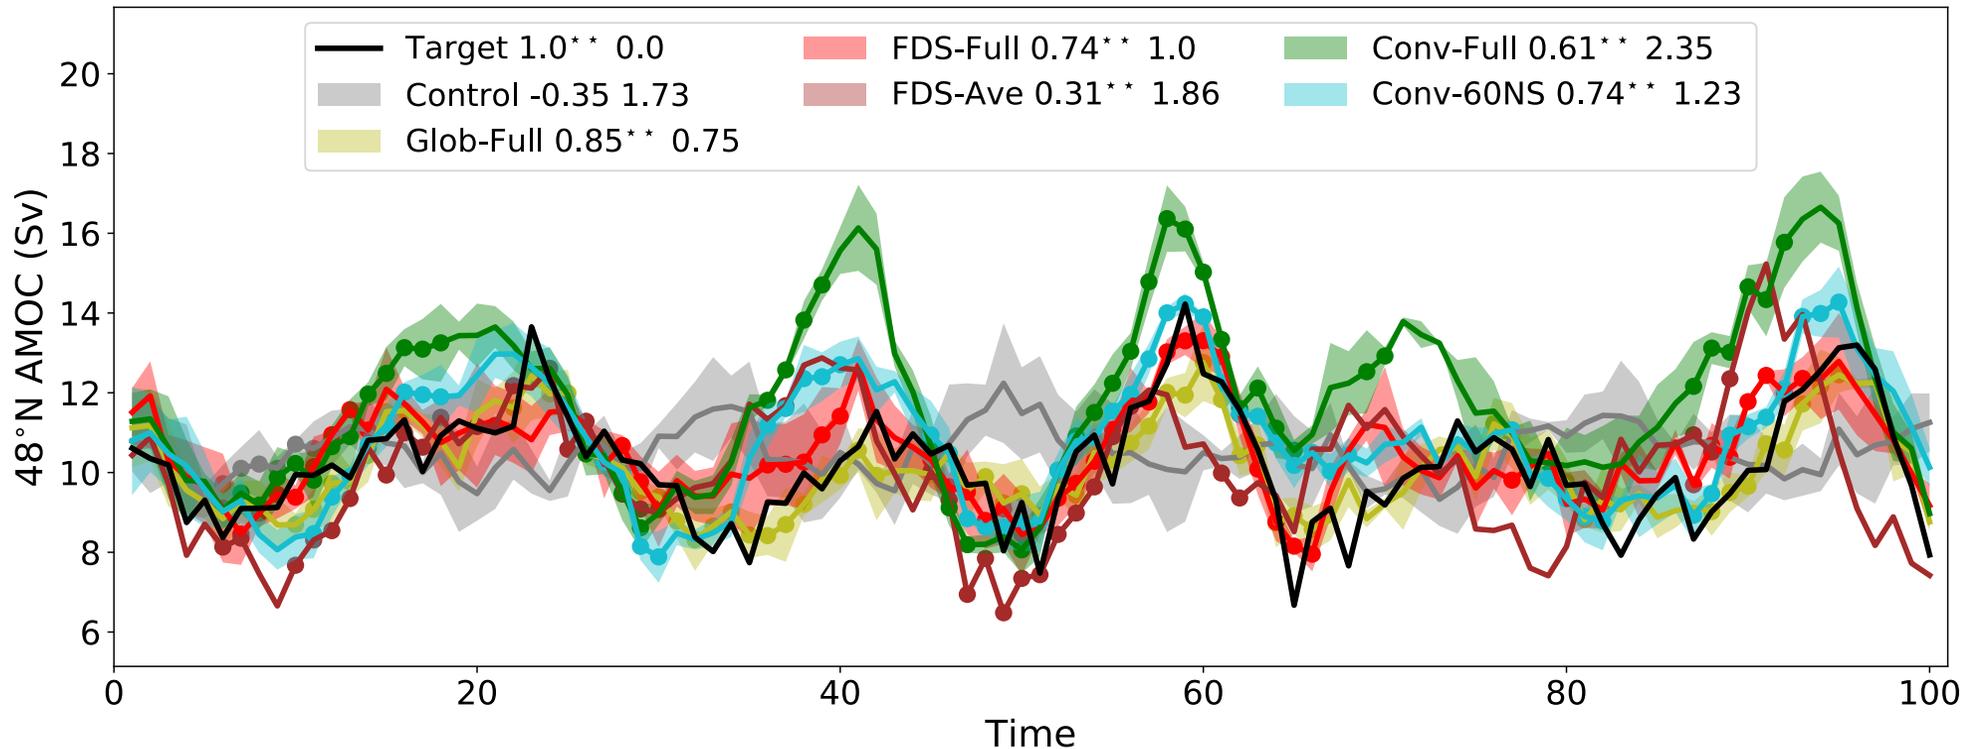

Reduce the SSS resolution to the given by FDS

2 metrics

- Pearson correlation on annual means (R)

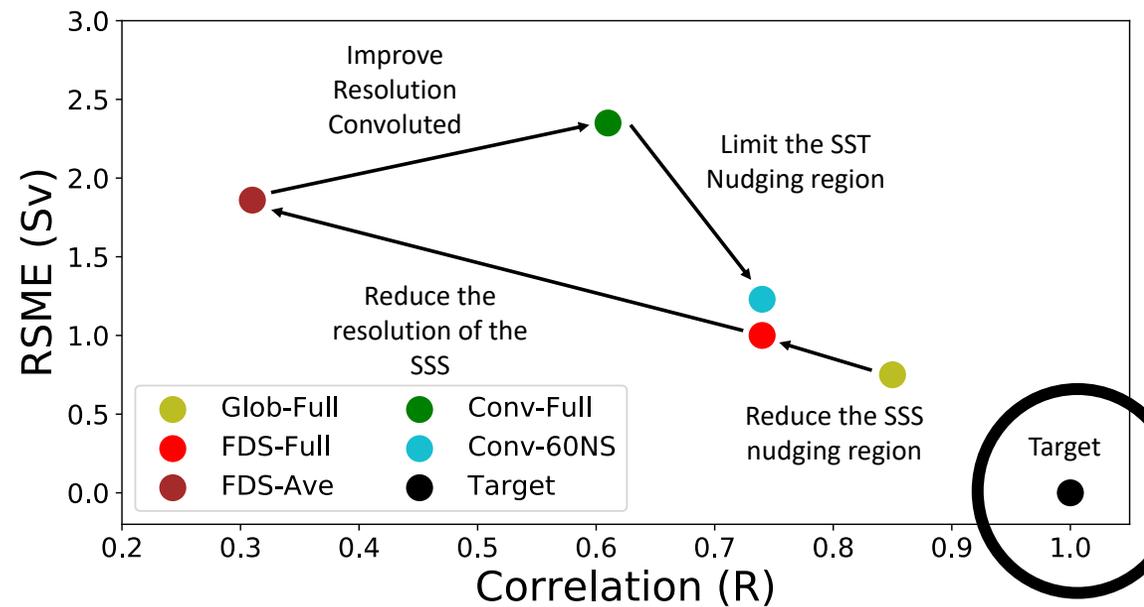

- Root Square Mean Error (RSME)

2 Problems to solve

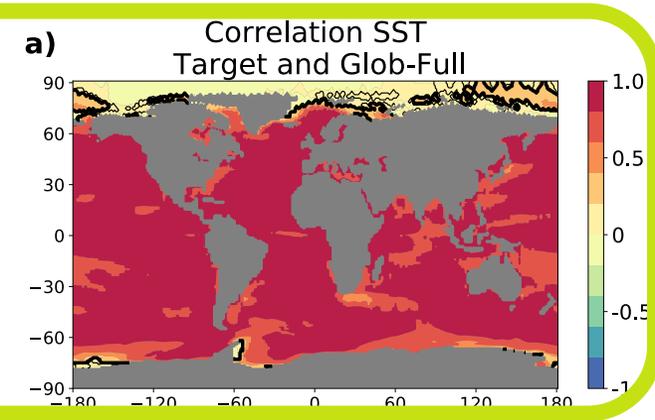

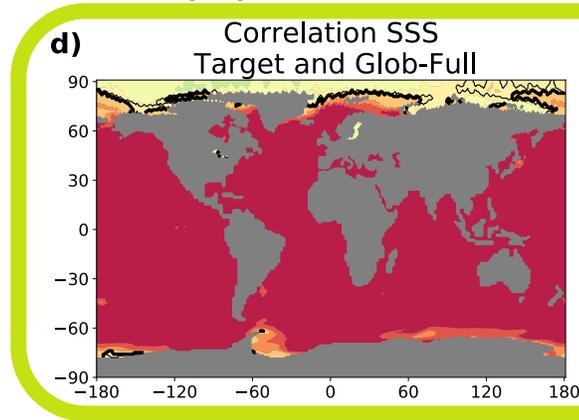

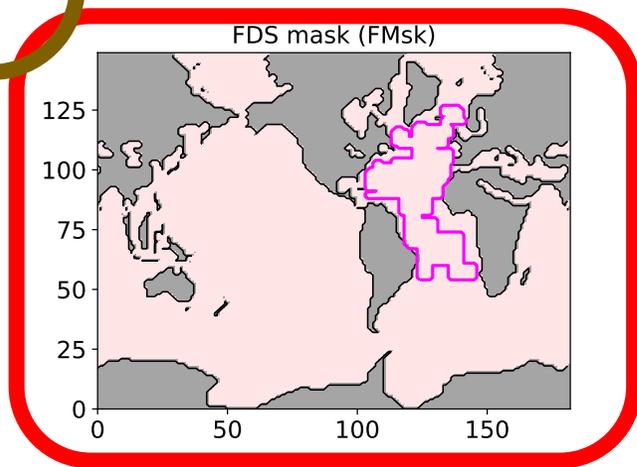

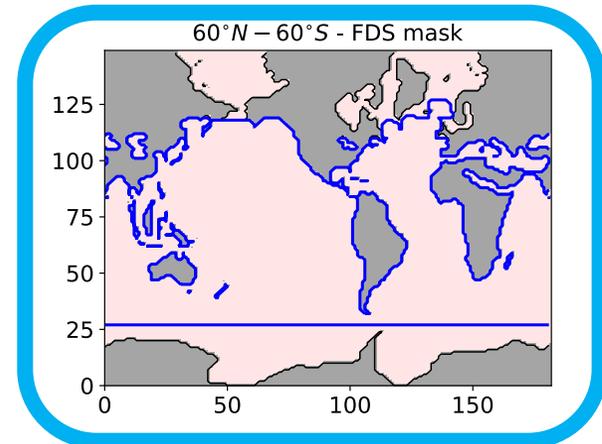

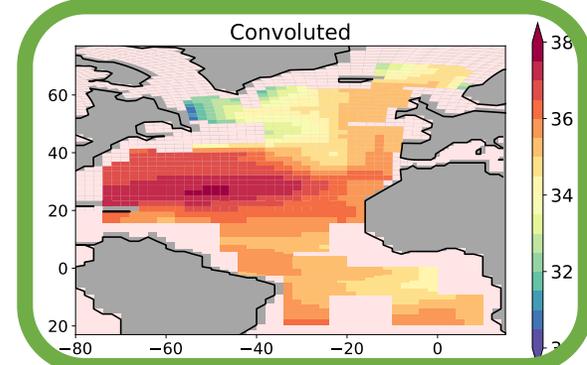

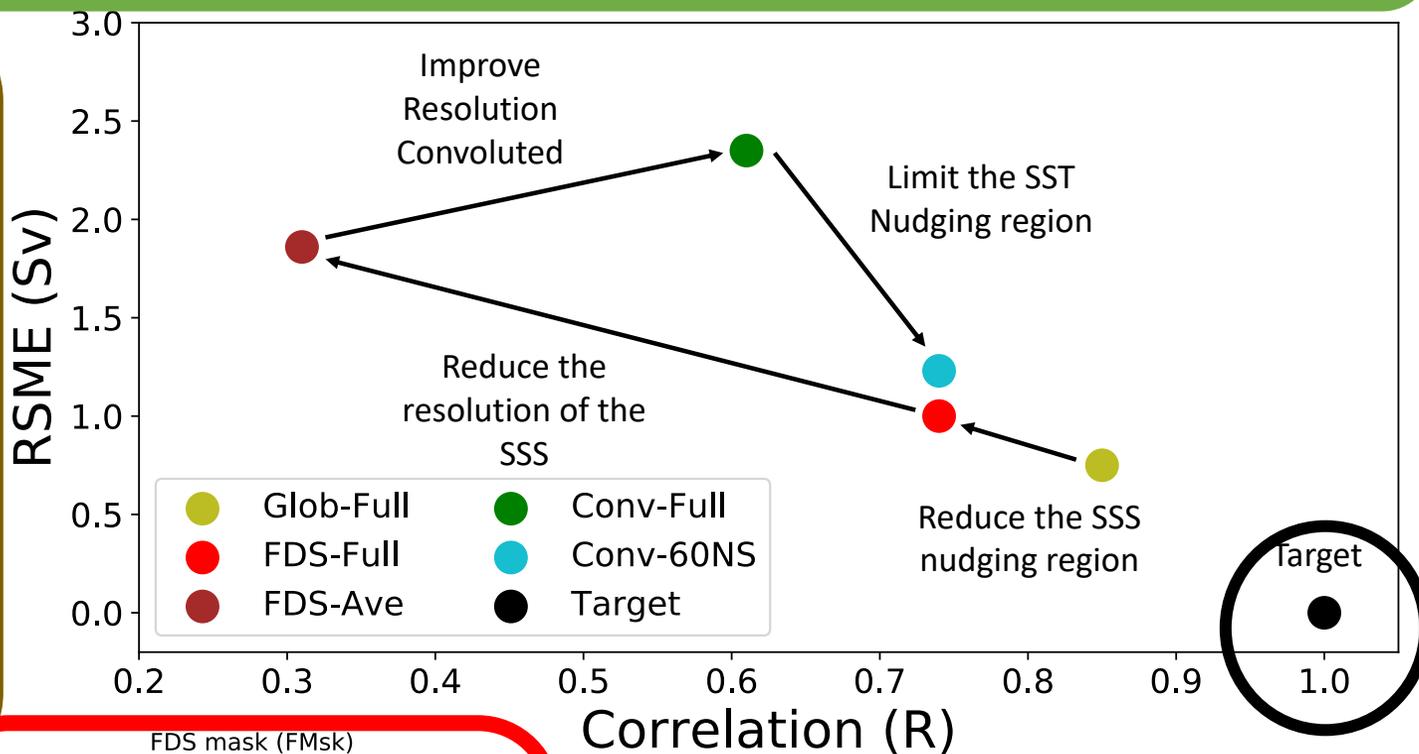

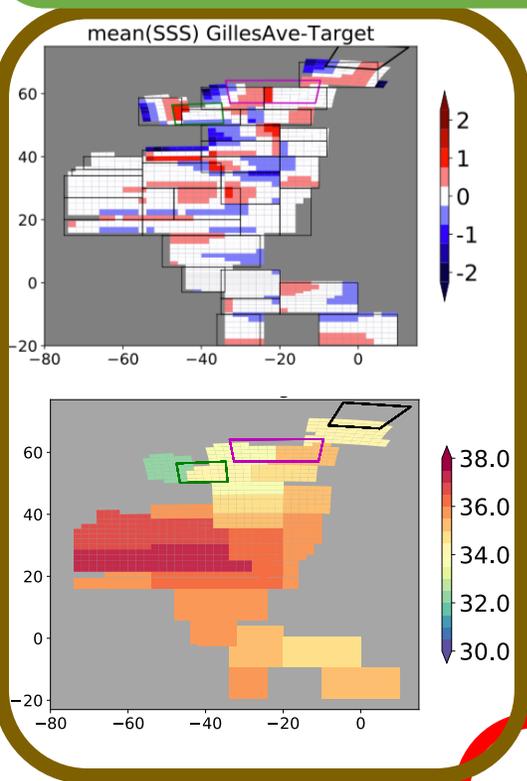

Reduce the SSS nudging region to the FDS mask

Reduce the SSS resolution to the given by FDS

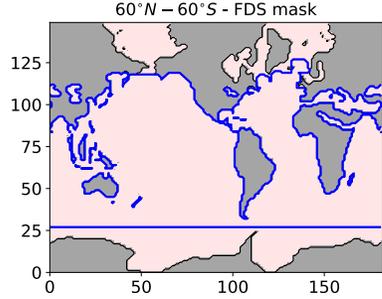

$$SSS_{Conv}[x, y, t] = SSS_{FAve}[Box_n(x, y), t] * SSS'_{climat}[x, y] \quad (1)$$

for t in monthly values, (x, y) gridpoints of the ORCA2 grid and $n(x, y)$ the FDS-box.

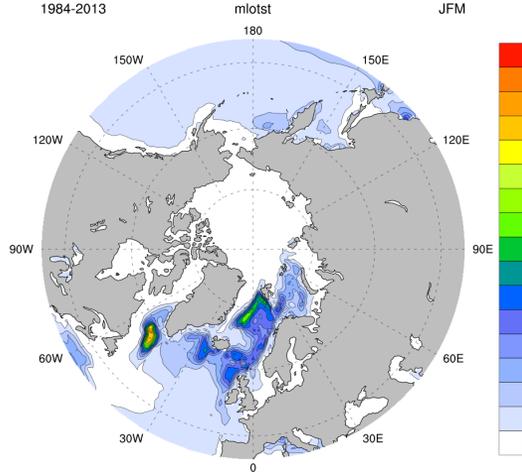

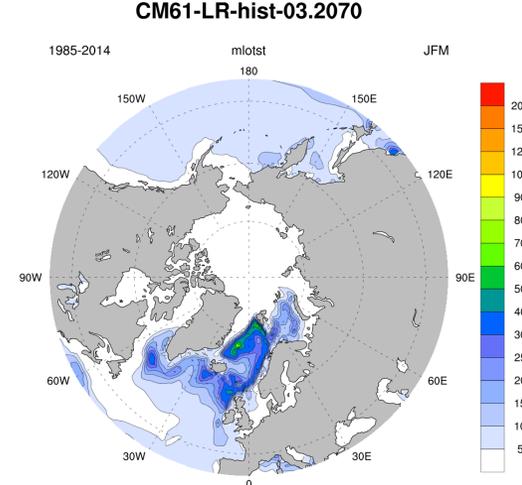

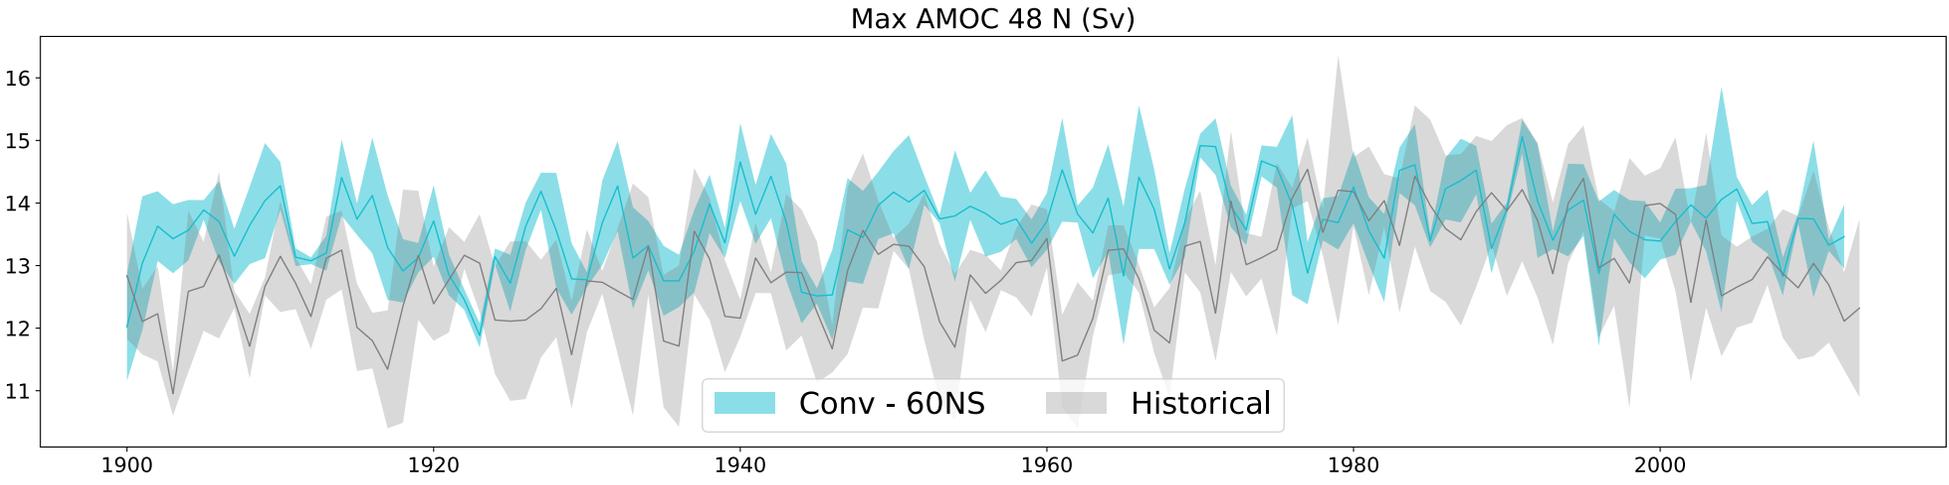

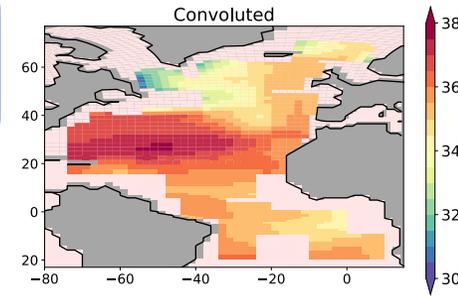

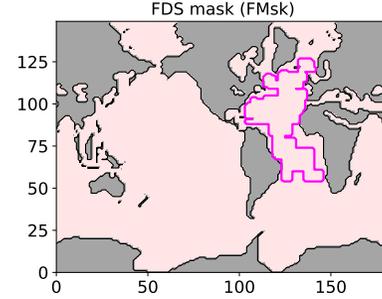

ORCA1

Our final configuration – IPSLCM6

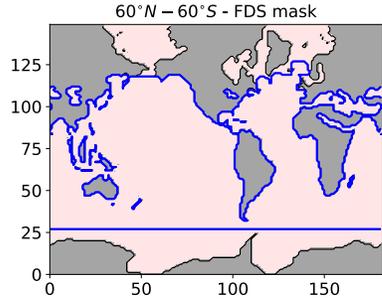

SST

SSS

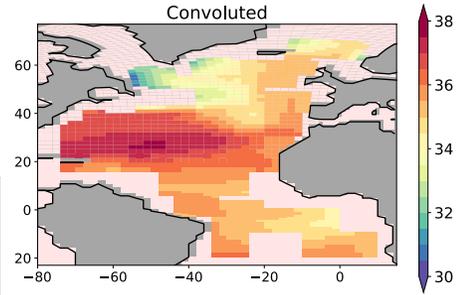

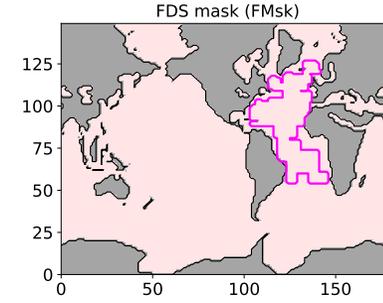

ORCA1

Our final configuration – IPSLCM6

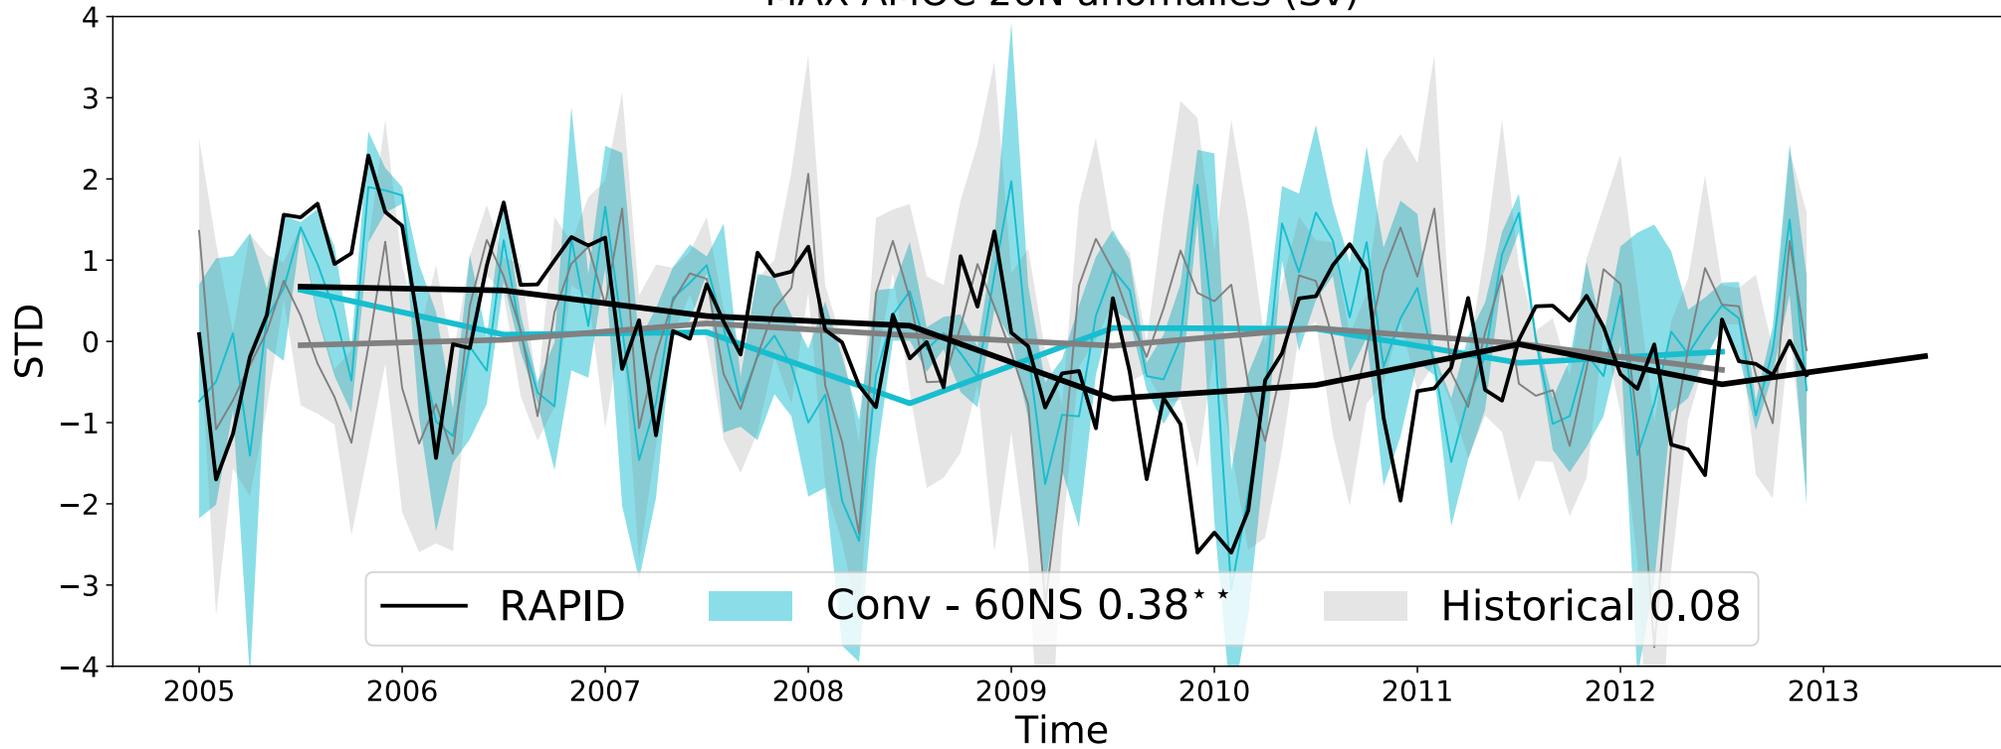

SST

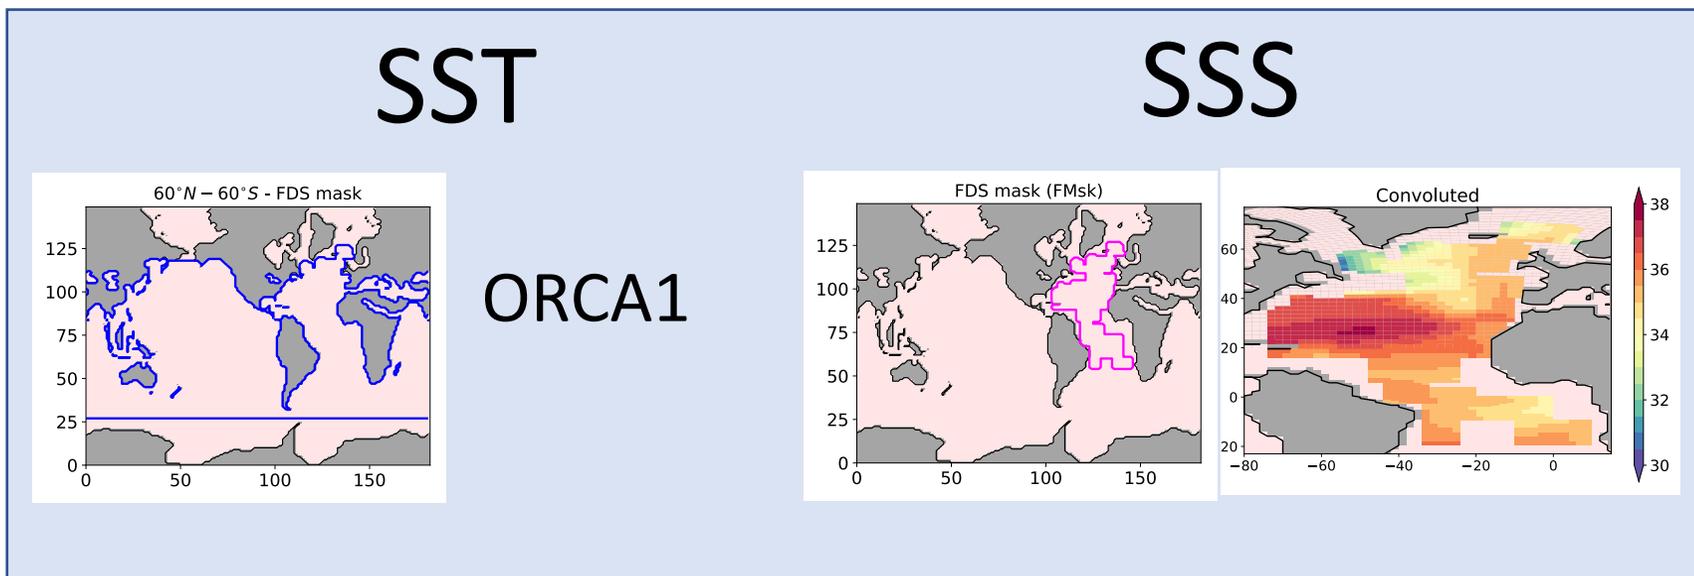

SSS

MAX AMOC 26N anomalies (Sv)

Conclusions

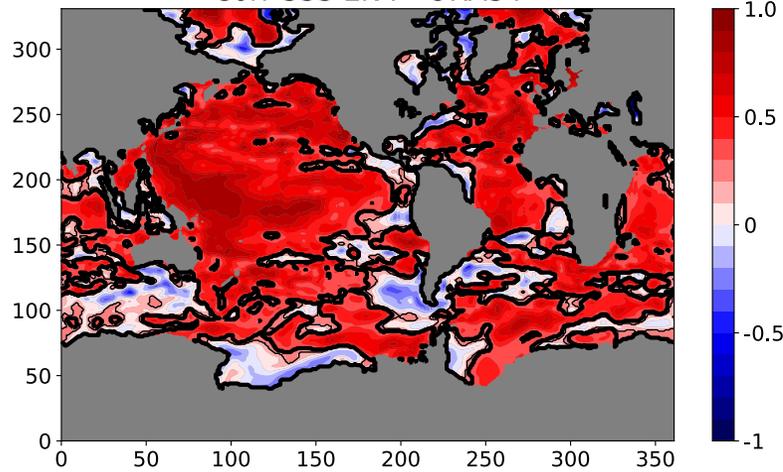

- Analyse the results of the reconstruction
- Compare to other reconstructions (Caesar 2018, Thornalley 2018, Jackson 2016, E. Frajka-Williams 2015, etc.)

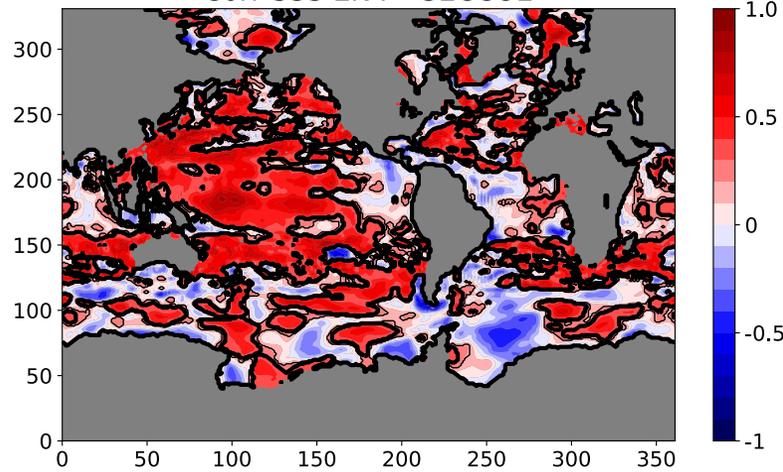

Future work ➤ *Did we improve predictability?*
➤ *Include winds? (Ortega et al. 2017)*
